

KOT246 Track Profile

Koltek Access System includes several types of track profiles that give you a flexible range of alternatives for the design of traversing ladders and gantries.

KOT246 track profile is used when the span between support brackets are up to 6 meters.

The aluminium alloy used in the Koltek® Track produced by Hydro Aluminium is stronger than most of the aluminium tracks available in the market today. You will be able to increase the span between the brackets and you will reduce the installation costs. Less brackets and shorter time of installation.
